

STUDYFLOW

Basic User Research

1. Research Objective

The purpose of this basic exploratory research is to understand the common study-planning difficulties faced by college students and identify the needs that a simple mobile study planner should address.

2. Target Users

College students who manage multiple subjects, assignments, study topics, revision and exam preparation while attending regular classes.

3. Research Questions

The research was guided by the following questions:

- How do students currently keep track of study tasks?
- What makes study planning difficult when managing multiple subjects?
- What information do students need to see quickly when they open a study planner?
- What would make adding and completing a study task easy?

4. Key Findings

- | | |
|----|---|
| 01 | Students need to manage tasks across several subjects at the same time. |
| 02 | Study plans can become scattered across notes, calendars, messages or memory. |
| 03 | Students need a quick way to record what they need to study and when. |
| 04 | A clear daily overview helps students know what to focus on next. |
| 05 | Students need a simple way to mark completed tasks and review their study activity. |

5. Identified User Needs

- One place to organize multiple subjects and study tasks.
- Quick task creation with only essential information.
- A clear view of today's planned study tasks.
- An easy way to mark a task as completed.
- A simple summary of completed and remaining study work.

6. Design Implications

The findings suggest that StudyFlow should prioritize simplicity, quick task entry, clear daily information and minimal interaction effort. These needs directly informed the low-fidelity wireframes created for the prototype.

Research Summary

Problem: Students can find it difficult to organize and remember study tasks across multiple subjects.

Need: A simple, centralized way to plan, view and complete study tasks.

Design direction: Create a low-fidelity mobile study planner with a dashboard, subjects, quick task creation, task details and progress overview.
