

STUDYFLOW

Design Thinking Process

1. Empathize

The first stage focused on understanding the everyday study-planning difficulties of college students. Students often manage multiple subjects and need to remember different topics, tasks and study times.

Key observation: Students need a simple planning experience that does not require a lot of effort to maintain.

2. Define

The problem was defined as follows:

College students need a simple way to organize, plan and track study tasks across multiple subjects without using a complicated productivity system.

Design challenge: How might we help students quickly decide what to study, record it and keep track of completed work?

3. Ideate

Several possible features were considered based on the identified user needs:

Home Dashboard	Show today's study tasks in one place.
My Subjects	Organize study activities by subject.
Quick Task Creation	Allow users to add a task using only essential information.
Task Details	Provide the details of a selected task and an option to complete it.
Progress	Give users a simple overview of completed and remaining work.

4. Prototype

The selected ideas were converted into low-fidelity mobile wireframes. The prototype uses simple grayscale shapes, basic text and straightforward navigation so that the focus remains on the user experience and information structure rather than visual styling.

Prototype screens:

1. Welcome / Login
2. Home / Dashboard
3. My Subjects
4. Add Study Task

5. Task Details

6. Progress

5. Test

The prototype is intended to be reviewed with students to check whether the navigation and task flow are easy to understand.

Things to evaluate:

- Can the user understand what to do from the Home screen?
- Is adding a study task quick and clear?
- Can the user easily find the details of a task?
- Is the completion and progress information understandable?

6. Iteration Plan

Based on feedback, unnecessary fields or steps can be removed, unclear labels can be changed and the navigation can be simplified. The prototype can then be refined into a higher-fidelity design.

7. Final Design Direction

The design thinking process resulted in a simple mobile study planner focused on four core principles: **clarity, simplicity, quick task management and easy progress tracking.**

Process Summary

Empathize → Define → Ideate → Prototype → Test → Iterate
